Introduction

Applications

The Barksdale Tank Level Indicating Systems are sensors for remote indication level of liquid media.

They operate according to the float principle with magnetic transmission (Permanent magnet, Reed switch and resistor chain). The liquid level is indicated on indicating instruments connected to the sensor.

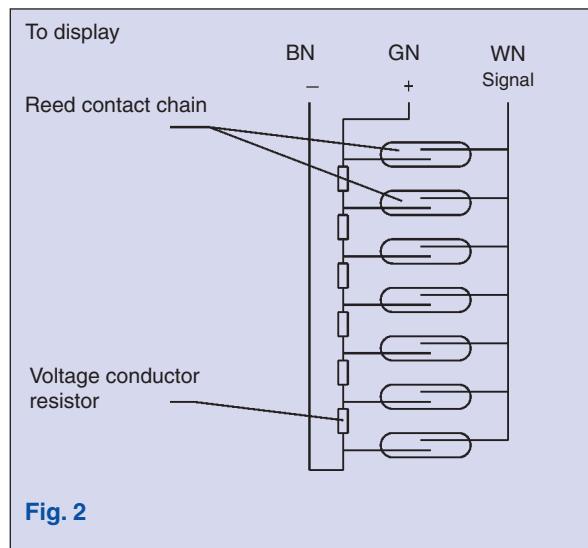

Typical Applications for Tank Level Indicating Systems:

Waste water and sewage plants, filling and charging containers, heating oil tanks, remote level indication for rivers, canals and basins, radioactive fluids, tank trucks, drinking water and fuel containers for tanks or motor ships, trim and ballast tanks of oil rigs and submarines, interfacial level indicator for fluid of different densities as well as path sensing elements for indication and control of stroke movements e. g. of hydraulic and pneumatic cylinders.

Introduction

Operation

The stem contains a full length internal network tapped by magnetically actuated Reed switches mounted at 6,4 mm intervals. A constant voltage across the resistance forms the voltage divider network. Tap switches are connected to a common conductor via series resistors to the receiver meter and are actuated by bar magnets within the float as it traverses the transmitter stem. The float varies the tap point on this voltage divider by raising and falling with liquid level.

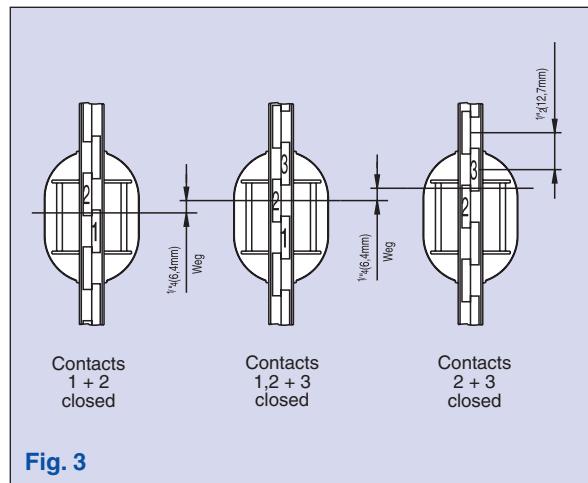

All wetted parts are made of stainless steel or brass and are available with various mounting elements.

The standard float material is Cr-Ni-steel (1.4571, 1.4408)

PVC or brass are also available on request.

Fig. 2 shows the electrical operation of the Barksdale Tank Level Indicating Systems.

Safety Switching Function

Magnetic reed switches are tapped into a voltage divider resistance at 6,4 mm intervals within the transmitter and connected to a remote indicating meter.

The magnet-equipped float closes these switches in a „2-3-2“ sequence as it moves as shown in Fig. 3. When two switches are closed, the effective tab point is halfway between the two. When the float moves another 6,4 mm and closes the next switch, while holding the first closed, the effective tap point is at the middle switch of the three and one 3,2 mm from the first tab point. Therefore, a voltage is read at the meter for each 6,4 mm of float travel.

Transmitter Accuracy

Depending on requirements and model different screen sizes are available:

R12 - (1/4" = 6,4 mm), accuracy appr. 0.2% at 3000 mm - standard
R08 - (1/6" = 4,2 mm), accuracy appr. 0.1% at 3000 mm - on request

The measuring accuracy of the level sensor can be calculated by using the following formula in accordance to the measuring length:

$$\pm \frac{\left(\frac{\text{Screen}}{2} \pm 5 \text{ mm} \right)}{\text{Measuring length Lm}} \times 100\%$$

$$\text{e. g.: } \pm \frac{6,4 \text{ mm}}{1000 \text{ mm}} \times 100\% = 0,64\%$$

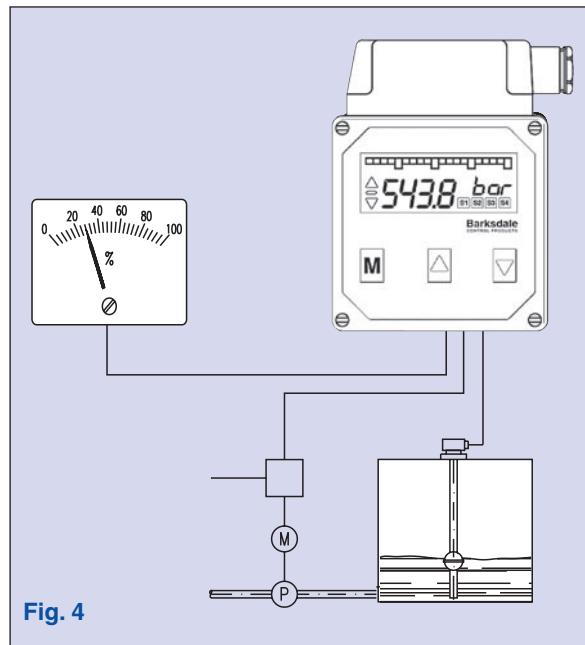

Introduction

Installation and Maintenance

12 / 04 TLI US 01/1

Barksdale Tank Level Indicating Systems

Specifications are subject to changes without notice.

The transmitters can be installed from outside through the tank top or tank bottom by using a mounting plug or flange.

The mounting position is vertical with a maximum angle of inclination of 30 degrees.

The level sensor and additional instruments are maintenance free in applications in clean media. The maintenance of the level sensor consists of an occasional „wipe-off“ cleaning from time to time in excessively contaminated liquids.

For the sensor connection shielded cable or wiring is recommended but not necessary.

The level sensors are available with terminal box, plug or PVC-cable. If the distance between sensor and display exceeds 15 m, a 4...20 mA 2-wire connection should be used for signal transmission (please see also page 18 / 19: Transducer).

The cable length between sensor and receiver can be up to five kilometers using a transducer, depending on the cable diameter.

Fig. 4 shows a typical application with pump control, additional display and recorder.

Technical Advantages

- Constant level monitoring with <0,5 mm repeatability.
- Independent on foam formation, variable dielectric, conductivity, pressure and temperature of the liquid.
- Remote level indication via extremely long cables between level indicating system and level sensing element (container).
- Interfacial level indication possible by different float weights.
- Linear level indication independent of the shape of the container by transducer linearization via PC.
- The level sensors can be inserted in protection and bypass tubes in extremely turbulent or contaminated liquids.
- Continuously adjustable setting of the electronic maximum and minimum level value relays without moving the float or filling / emptying the container.
- Dotted line recorders, trip amplifiers and other additional instruments can be connected to the level indicating system with analog output.

Trip Amplifier and Indicating Instrument

Type UAS 3 - V3

Trip amplifier for pressure, temperature, level, etc., digital display, 4 switching outputs and 1 analog output, accuracy class 0,2% f. s.

Features

8-digit 14-segment LCD display with bargraph and trend indication, microprocessor-controlled, self monitoring, all parameters are configured by keypad, units selectable, high accuracy, selective keypad lock, quick scanning rate (1 ms)

Display Range (free scalable): -9999...+9999

Applications

OEM-applications, hydraulics and pneumatics, test beds, heavy industry

Type MU3L

Function

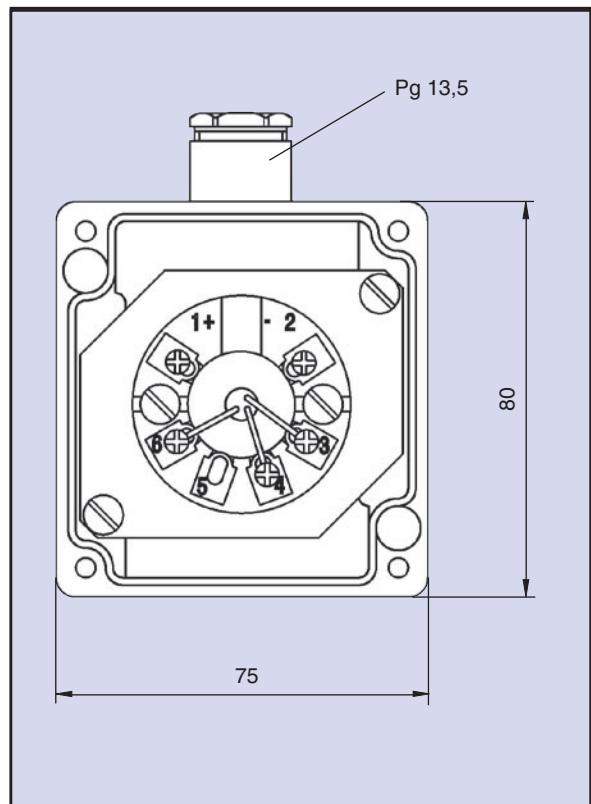

The R/I transducer type MU3L transforms the electrical resistance of the level sensor (3-wire potentiometer circuit) into a load independent output current of 4...20 mA. It is installed in the level sensor connection head.

The built-in wire breaking protection reduces the exit current to 3,8 mA in case of wire breakage. Special configurations are possible and programmable via PC.

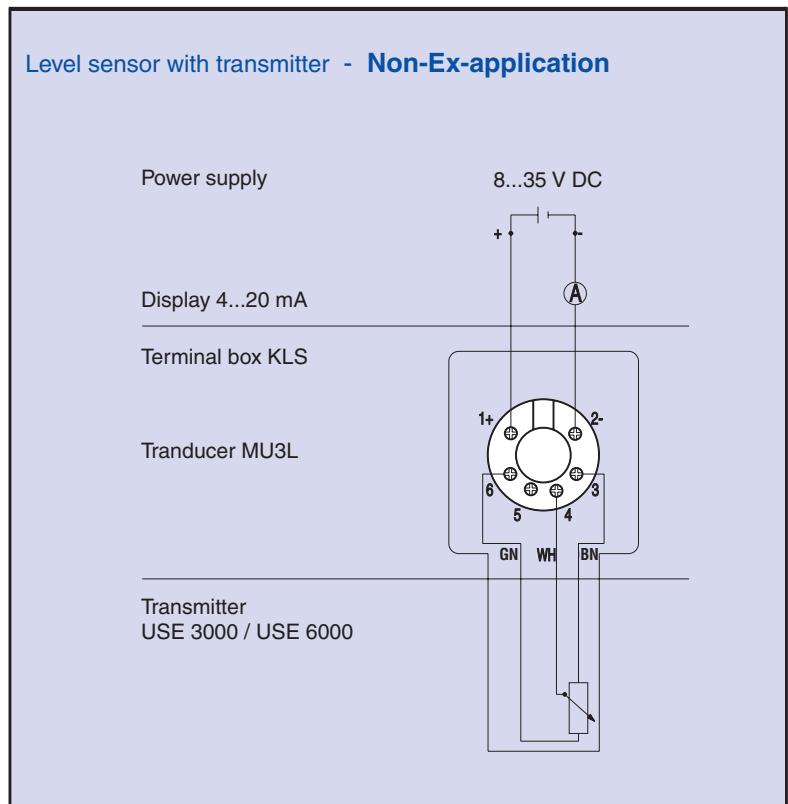

Technical Data

Power Supply	: 8...35 V DC
Output Signal	: 4...20 mA
Refresh Rate	: 7,4 Hz

Level Indication Circuit	: 3-wire potentiometer circuit

Dimensions (in mm)

Connection Scheme

Type MUEX

Function

The R/I transducer type MUEX is designed for applications in hazardous areas. It transforms the electrical resistance of the level sensor (3-wire potentiometer circuit) into a load independent output current of 4...20 mA and is installed in the level sensor connection head.

12 / 04 TLI US 01/1

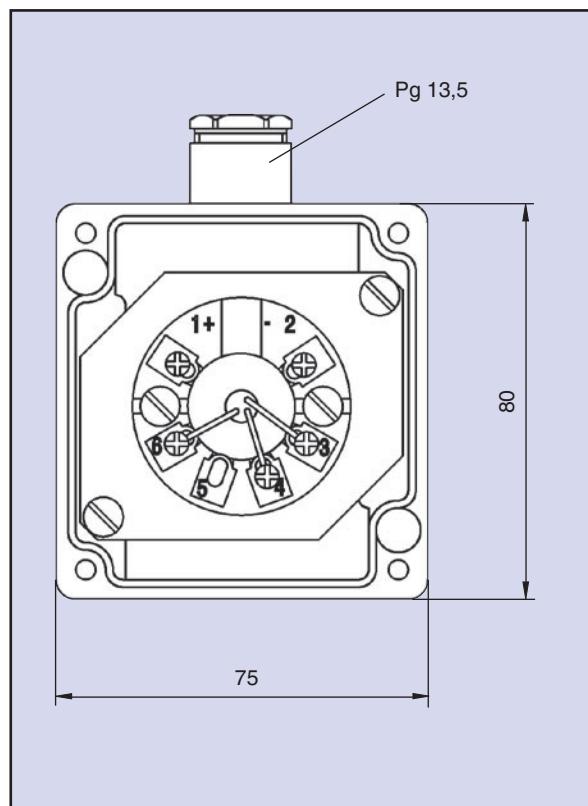

The built-in wire breaking protection reduces the exit current to 3,5 mA in case of wire breakage. Special configurations are possible and programmable via PC.
